| Design Parameters |       |
|-------------------|-------|
| Parameters        | Value |
| b                 | 5     |
| h                 | 3     |
| $\angle A$        | 70    |

TABLE 2.2: Trapezium  $ABCD$

## 1 PROBLEM

If the non-parallel sides of a trapezium are equal, prove that it is cyclic.

## 2 CONSTRUCTION

Fig. 2.0: Trapezium by Latex-Tikz

2.1. The figure obtained looks like Fig. 2.0.

$AD = BC$ ,  $AB \parallel DC$ .

2.2. The design parameters used for construction  
See Table. 2.2.

2.3. Find the coordinates of the various points in Fig

$$\mathbf{A} = \begin{pmatrix} 0 \\ 0 \end{pmatrix} \quad (2.3.1)$$

$$\mathbf{B} = \mathbf{A} + \begin{pmatrix} a \\ 0 \end{pmatrix}, \quad (2.3.2)$$

$$\mathbf{AP}_1 = -\mathbf{BP}_2 = \begin{pmatrix} h \cot \theta \\ 0 \end{pmatrix} \quad (2.3.3)$$

$$\mathbf{P}_1\mathbf{D} = \mathbf{P}_2\mathbf{C} = \begin{pmatrix} 0 \\ h \end{pmatrix} \quad (2.3.4)$$

$$\mathbf{C} = \mathbf{B} - \mathbf{BP}_2 + \mathbf{P}_2\mathbf{C} \quad (2.3.5)$$

$$\mathbf{D} = \mathbf{A} + \mathbf{AP}_1 + \mathbf{P}_1\mathbf{D} \quad (2.3.6)$$

2.4. **Solution:** From the given information, The values are listed in 2.4

| Ouput values |   |
|--------------|---|
| Parameter    | Value                                     |
| <b>C</b>     | $\begin{pmatrix} 3.9 \\ 3 \end{pmatrix}$  |
| <b>D</b>     | $\begin{pmatrix} 1.09 \\ 3 \end{pmatrix}$ |

TABLE 2.4: Values of  $\mathbf{C}$  and  $\mathbf{D}$

2.5. Draw Fig. 2.0.

From equation 5.1:

$$\angle B + \angle D = 180^\circ \quad (5.4)$$

$$\angle A + \angle C = 180^\circ \quad (5.5)$$

$\therefore ABCD$  is a cyclic quadrilateral.

Fig. 2.5: Trapezium generated using python

**Solution:** The following Python code generates Fig. 2.5

```
codes/quad.py
```

and the equivalent latex-tikz code generating Fig. 2.5 is

```
figs/trapezium_altitude_fig.tex
```

The above latex code can be compiled as a standalone document as

```
figs/trapezium_final_altitude.tex
```

### 3 SOLUTION

To Prove  $ABCD$  is a cyclic quadrilateral.

**Solution:** Inorder to prove that  $ABCD$  is a cyclic quadrilateral, it is necessary to prove that sum of opposite angles is  $180^\circ$ .

In  $\triangle ADP_1$  and  $\triangle BCP_2$

$$\angle AP_1D = \angle BP_2C$$

$$P_1D = P_2C$$

$$AD = BC$$

$$\therefore \triangle ADP_1 \cong \triangle BCP_2$$

$$\implies \angle A = \angle B \quad (5.1)$$

Since  $AB \parallel DC$

$$\angle A + \angle D = 180^\circ \quad (5.2)$$

$$\angle B + \angle C = 180^\circ \quad (5.3)$$
